

PABLO COSTA

DevOps Engineer · CI/CD · IaC · AWS · Automation & Observability

pablohzh@gmail.com · +55 31 99168-3587 (WhatsApp) · Belo Horizonte, Brazil

pablohzh.cloud · LinkedIn

Fluent English · Available for remote roles (US & global)

PROFESSIONAL SUMMARY

Software engineer with 18 years in technology, focused in recent years on AWS serverless architecture, infrastructure as code, and shipping SaaS platforms end-to-end.

I solve a specific problem: when a company needs someone who owns the full path from architecture design to production deployment without org-wide dependencies. I have architected and shipped three SaaS platforms solo — including a multi-tenant product with payments, auth, and media processing on AWS, delivered solo in 46 days with 230+ commits, all provisioned through Terraform and deployed via GitHub Actions with zero manual console operations.

What sets me apart isn't cloud alone. It is deep systems expertise built over six years developing prepress software for the Swiss printing industry — binary image manipulation, reverse engineering of proprietary formats, and hardware integration. That toolkit shows up when problems leave the happy path: debugging latency, optimizing cost, integrating legacy systems, and choosing between managed services and building in-house.

CORE STRENGTHS

CI/CD & Release Engineering

Jenkins, GitHub Actions, AWS CodePipeline; dev → staging → production flows, environment promotion and release automation.

Observability & Monitoring

Grafana, CloudWatch, X-Ray and Zabbix; operational dashboards on live data instead of manual exports.

Infrastructure as Code

Terraform multi-module, remote state, workspaces, reusable environments and zero manual console operations.

Automation & Sustainment

Hybrid Linux and Windows, Bash and PowerShell scripting, Docker/ECS containers and production troubleshooting.

Cloud & CloudOps (AWS)

Architecting and operating serverless and container workloads on AWS — cost-aware service selection, resiliency and day-2 operations.

AI-Assisted Engineering

Daily, disciplined use of Claude and GPT across planning and execution — cross-reviewing plans and output, with mandatory human review.

CERTIFICATIONS

- AWS Certified Solutions Architect – Associate (SAA-C03) · Aug 2024 – Aug 2027
- AWS Certified Data Engineer – Associate (DEA-C01) · Oct 2025 – Oct 2028
- AWS Certified AI Practitioner (AIF-C01) · Dec 2025
- Microsoft Certified: Azure Administrator Associate (AZ-104)
- AWS Certified CloudOps Engineer – Associate (SOA-C03) · *in progress*

PROFESSIONAL EXPERIENCE

Tier-3 IT Engineer · PRODEMGE

Oct 2022 – Mar 2026

Belo Horizonte, Brazil

PRODEMGE — the technology agency of the State of Minas Gerais — operates heterogeneous corporate infrastructure with systems at different maturity stages.

- Designed the CI/CD pipeline for the GPD-9 project on Jenkins, defining the dev → staging → production flow and reducing manual release work.
- Owned the migration of CA SDM (Broadcom's service management platform) from on-premise to proprietary hybrid cloud, configuring dev, staging and production environments for faster resource availability and more predictable rollouts.
- Built operational dashboards in Grafana with Impala SQL queries against the corporate data lake, replacing panels based on manual CSV exports with live data.
- Built REST APIs (Spring Boot + WSO2) that consolidated SQL logic scattered across systems, exposing token-authenticated endpoints with per-area scope control and full auditability.
- Built an internal proof-of-concept for document Q&A over a self-hosted Gemma LLM: ported a reference Python script into a .NET console application that submitted PDFs to the model and queried their content, exploring retrieval-augmented generation for internal use cases.
- Deployed and customized CA xFlow and Service Point (CA SDM 17.4) — chatbot scripts, service rules and ticket structure — for clients such as Detran-MG and the State Department of Education.
- Migrated approximately 130 SAP BusinessObjects reports to the upgraded platform and built 30+ additional reports with custom metrics (service time, incident counts, requests per analyst).

Software Engineer (Remote Consultant) · Digital Information AG

2016 – 2022

Zurich, Switzerland (Remote)

Digital Information AG sells high-ticket software to the European printing industry — tools for companies that manage industrial ink volumes and need precise print previews before production. I operated as a remote consultant for six years, owning two legacy products that required modernization.

- Architected and shipped InkZone PPI from scratch in C# + WinForms on top of a proprietary Pascal codebase without complete documentation — real-time folder monitoring, PPF validation, binary/text extraction, automatic previews and XML outputs for downstream systems.
- Migrated and modernized DI-Plot, handling the extended PPF/PostScript format: learned PostScript from scratch, implemented in-memory and on-disk RLE decompression, and used OpenCV/ImageMagick for channel conversion, binary header rewrites and dynamic canvas composition.
- Led modernization of legacy codebases (Pascal → C#) enabling JDF parsing, and reverse-engineered undocumented in-house applications to recover lost functionality.
- Engineered image pipelines combining TIFF negatives into color outputs with PANTONE-to-CMYK mapping and grayscale analysis, moving manual operations into unattended production flows.

Software Engineer · ENotas

2019 – 2020

Belo Horizonte, Brazil

ENotas integrates electronic invoicing with municipal tax authorities across Brazil — an operation dependent on crawlers extracting heterogeneous PDFs from hundreds of portals.

- Built data extraction and standardization pipelines for crawler-captured PDFs, applying PostScript expertise to isolate relevant content and assemble headers/footers in memory.
- Developed cross-platform hardware integration with thermal and fiscal printers (C# and Kotlin) for automated receipt generation at scale.

INDEPENDENT PLATFORMS

Three platforms designed, built and shipped to production solo. All engineered and shipped end-to-end — Terraform + GitHub Actions, no manual console operations.

COSMOFIT Workout Builder · Founding Engineer · Live in production

100% serverless SaaS on AWS for gyms and personal trainers tired of managing workouts via spreadsheets, WhatsApp and printouts. Delivered in 46 days, fully managed through Terraform with a GitHub Actions pipeline.

SuperZap · Multi-Tenant WhatsApp CRM for Call Centers

Built from a real pain point observed during years of consulting for call centers: managers had no operational visibility into WhatsApp and were exposed to message deletion. Delivers real-time visibility, message auditing (including deleted messages), operator blocking and conversation takeover.

SuperDoc · Serverless Document Processing Platform

Live serverless platform for converting and processing PDFs, DOCX, XLSX and images (video on the roadmap), built as a free or low-cost alternative to paid conversion tools.

TECHNICAL SKILLS

CI/CD & Automation: GitHub Actions, Jenkins, AWS CodePipeline, Git-based workflows, environment promotion, release automation.

Infrastructure as Code: Terraform (multi-module, remote state, workspaces), CloudFormation.

Containers & Orchestration: Docker, ECS, EC2 Spot fleet management.

Observability: Grafana, CloudWatch, X-Ray, Zabbix.

Cloud (AWS): EC2, Lambda, S3, ECS, DynamoDB, RDS, API Gateway, EventBridge, CloudWatch, Route 53, IAM, Step Functions, Textract, Bedrock, Cognito, Amplify, CloudFront, SQS, SNS.

Cloud Security: IAM least privilege, RBAC, Cognito authentication flows, VPC segmentation, Security Groups, VPN, token-scoped APIs, auditability, secure multi-tenant design.

Scripting & OS: Bash, PowerShell; hybrid Linux and Windows administration.

Messaging & Streaming: SQS, SNS, EventBridge, Kinesis, RabbitMQ.

Data: DynamoDB, RDS/MySQL, Athena, Glue, S3 data lakes, Redshift.

Languages: Python, Java, TypeScript/JavaScript, C#, SQL, Bash.

AI in the Workflow: daily use of Claude (chat and Claude Code) and GPT (web and Codex) across planning and execution — alternating tools and cross-reviewing each other's plans and output, with mandatory human review. Familiar with self-hosted LLMs and retrieval-augmented generation (RAG) from internal prototyping.

LEARNING & FOCUS AREAS

Active study areas I am building toward production depth, currently practiced in personal projects and labs:

- Kubernetes / container orchestration — foundational knowledge; building hands-on experience beyond Docker/ECS.
- GitOps and declarative deployment workflows.
- AWS CloudOps practices (SOA-C03 exam preparation in progress).
- Progressive delivery and deployment strategies (blue/green, canary).

EDUCATION & LANGUAGES

- B.S. in Information Systems — Centro Universitário UNIBH (2016–2020)
- B.S. in Computer Networks — Faculdade Estácio de Sá (2010–2013)
- Postgraduate Degree in Artificial Intelligence and Machine Learning — PUC Minas (2025–2026)
- Portuguese (native) · English (fluent — 6 years working remotely with Switzerland)
